Your Review Plan

Complete these four stages to quickly refresh the essential ideas and confirm you're ready to continue.

4 stages • Approximately 5–10 minutes

1 Quick Recall Refresh what you already know.	2 Essential Idea Review the most important concept.
3 Confidence Check Confirm you're ready to move on.	4 Next Step Continue your learning.

PRINTING TIP

For student copies, print double-sided and keep the Quick Answers section after the student activities so learners attempt each activity before checking their work.

FR-04 • STAGE 1 OF 4

Quick Recall

Let's quickly refresh what you already know. This short recall activity will bring the most important ideas back to mind before you review them.

QUICK RECALL

Recall Activity

Recall the two relationships that distinguish ordinary heating from a phase change.

Complete the ideas: temperature change within one phase uses $Q = \underline{\hspace{1cm}}$; a phase change at the transition temperature uses $Q = \underline{\hspace{1cm}}$.

Ready to refresh the essentials?

Great! Now review the most important idea you'll want to remember.

Essential Idea

Take one last look at the most important concept from this topic. If you remember this idea, the rest will come back much more easily.

ESSENTIAL IDEA**Phase Change Energy: Latent Heat**

During melting, freezing, vaporization, condensation, sublimation, or deposition, energy is used to rearrange matter between phases. For a pure substance at fixed pressure, the temperature can remain nearly constant during the transition. The phase-change energy depends on mass and latent heat.

$$Q = mL$$

EXAMPLE For 0.10 kg of ice melting with $L_f = 334 \text{ kJ/kg}$, $Q = 33.4 \text{ kJ}$ is absorbed.

SENSEI NOTE Do not use $Q = mc\Delta T$ for the phase-change plateau itself.

Confidence Check

You've refreshed the essential idea. Now answer this quick confidence check to confirm you're ready to move on.

CONFIDENCE CHECK

Latent Heat Check

Choose the correct model and explain the energy direction.

Water vapor condenses to liquid at its transition temperature. Which relation applies, and is energy absorbed or released?

Ready for your next step?

Great work! You've refreshed the essential idea. Now choose the resource that best matches what you'd like to do next.

Quick Answers and Explanations

Use these concise answers to check your recall and confidence—not only your final response.

QUICK RECALL**Recall Activity**

Temperature change: $Q = mc\Delta T$. Phase change: $Q = mL$.

WHY IT WORKS The first changes temperature within a phase; the second accounts for latent heat during a change of phase.

CONFIDENCE CHECK**CONFIDENCE CHECK****Latent Heat Check**

Use $Q = mL_v$ for the magnitude. Condensation releases energy to the surroundings.

WHY IT WORKS Condensation is a liquid↔gas phase change, so L_v applies; the reverse of vaporization releases energy.
